

# Yin (Stanley) Cheung

Vancouver, BC | [yinstanleycheung@gmail.com](mailto:yinstanleycheung@gmail.com) | [github.com/cheuyin](https://github.com/cheuyin) | [stanleycheung.com](https://stanleycheung.com)

## EDUCATION

### The University of British Columbia

Expected November 2027

*B.Sc. Computer Science / Average 88%*

*Vancouver, BC*

- **Awards:** Dean's List (2023, 2025); Charles & Jane Banks Scholarship (2024)

## EXPERIENCE

### Software Engineer Intern

January 2024 — July 2024

VoltSafe Inc. | TypeScript, Express.js, PostgreSQL, AWS, React

*Vancouver, BC*

- Shipped RBAC for an internal admin dashboard with AWS Cognito so staff only reached the routes and data their role allowed.
- Built an S3-backed file API for a marina management app so document and image uploads did not go through the app server.
- Cut the marina app JS bundle 22% by pruning unused static assets after a Lighthouse pass.
- Dockerized a Prometheus monitoring service for CPU, RAM, and disk on 7+ EC2 web and database servers; the React client polled a REST API with React Query.

## PROJECTS

### CreateYourStory.ai | Python, FastAPI, React, SQLite ([GitHub](#))

June 2026 — July 2026

- Built a FastAPI background-job pipeline for LLM and image generation with persisted job status so the React client could poll instead of blocking on one long request.
- Validated model output as a Pydantic story graph (nodes, choices, endings) before saving, so broken generations failed closed instead of writing junk to SQLite.
- Added JWT/Argon2 auth, guest sessions, and ownership checks so saved stories stayed private to their owner.

### UBC Course Explorer | TypeScript, React, Express.js ([GitHub](#))

June 2026 — July 2026

- Built a React and Express app over 64,000+ UBC course sections across 189 departments, with grade-trend charts, instructor profiles, and a campus room finder.
- Implemented a JSON query language with nested AND/OR/NOT, wildcards, and GROUP-BY aggregations, plus field-level validation, covered by 100+ integration tests.

### AutoDater | TypeScript, Obsidian API ([Plugin](#))

May 2025 — July 2026

- Shipped an Obsidian community plugin that writes Created/Updated dates into note frontmatter (~450 downloads).
- After a Reddit post (~33k views), added date-format options, folder exclusions, and renameable property labels from user feedback; a 6-second debounce avoids extra writes while typing.

### Local AI Coding Agent | Python, Gemini API ([GitHub](#))

May 2026 — June 2026

- Built a Gemini agent loop that calls sandboxed file tools (read, write, run, delete) for up to 20 rounds until the task finishes.
- Validated every file-tool path against the working directory and rejected any that would escape it, so a bad tool call could not reach the rest of the filesystem.

### Pathfinding Visualizer | TypeScript, React, HTML5 Canvas ([Demo](#))

August 2024 — June 2025

- Built a TypeScript/React visualizer for Dijkstra, A\*, and DFS, plus recursive-backtracking maze generation.
- Rewrote grid rendering from React DOM to HTML5 Canvas with requestAnimationFrame, cutting redundant renders 86% (115k to 16k) and raising frame rate from 7 to 60+ FPS.

## SKILLS

- **Languages:** Python, TypeScript, SQL
- **Frameworks:** FastAPI, Express.js, React
- **Other:** PostgreSQL, Docker, AWS, Prometheus, Linux, Git
- **Agentic coding:** Cursor, Claude Code, MCP
- **Certifications:** AWS Certified Cloud Practitioner
